1. Skeletal System

The skeletal system provides structure and support for the dog's body. It consists of:

- **Skull:** Protects the brain and supports facial structures.

- **Spine:** Composed of vertebrae, it protects the spinal cord and provides flexibility.
- **Ribs:** Protects the heart and lungs.
- **Limbs:** The forelimbs (front legs) and hind limbs (back legs) support movement.

2. Muscular System

Muscles allow for movement and maintain posture. The major muscle groups include:

- **Flexors:** Muscles that bend joints.
- **Extensors:** Muscles that straighten joints.
- **Adductors:** Muscles that pull limbs toward the midline of the body.
- **Abductors:** Muscles that move limbs away from the midline.

3. Circulatory System

The circulatory system is responsible for transporting blood, nutrients, and oxygen throughout the body. Key components include:

- **Heart:** Pumps blood throughout the body.
- **Blood Vessels:** Arteries, veins, and capillaries that carry blood.
- **Blood:** Composed of red blood cells, white blood cells, plasma, and platelets.

4. Respiratory System

The respiratory system allows dogs to breathe and exchange gases. Its primary components are:

- **Nose:** Filters and warms incoming air.
- **Lungs:** Facilitate gas exchange.
- **Trachea:** Connects the throat to the lungs.

5. Digestive System

The digestive system processes food and absorbs nutrients. The main parts include:

- **Mouth:** Begins the process of digestion.
- **Stomach:** Breaks down food.
- **Intestines:** Nutrient absorption occurs here.
- **Liver:** Produces bile for fat digestion.

6. Nervous System

The nervous system controls bodily functions and responses to stimuli. It consists of:

- **Brain:** The control center of the body.
- **Spinal Cord:** Transmits signals between the brain and body.
- **Nerves:** Carry messages throughout the body.
