1. Geology

Geology is the study of the Earth, its materials, and the processes affecting it. Key concepts include:

- The Rock Cycle: Understanding the three main types of rocks—igneous, sedimentary, and metamorphic—and how they transform from one type to another.
- Plate Tectonics: The theory explaining the movement of the Earth's lithospheric plates and the geological features that result from these movements, such as earthquakes and volcanoes.

2. Meteorology

Meteorology involves studying the atmosphere and weather patterns. Important topics include:

- Weather vs. Climate: Understanding the difference between day-to-day atmospheric conditions (weather) and long-term averages (climate).
- Weather Systems: Recognizing the formation of different weather systems, such as high and low-pressure systems, and their impacts on weather patterns.

3. Oceanography

Oceanography is the exploration and study of the ocean's physical and biological properties. Key concepts include:

- Ocean Currents: The role of currents in regulating climate and weather patterns.
- Tides: Understanding the causes of tides and their effects on coastal ecosystems.

4. Astronomy

Astronomy looks at celestial objects and phenomena beyond Earth. Important areas include:

- The Solar System: Identifying planets, moons, asteroids, and comets within our solar system.
- The Universe: Understanding the structure of galaxies, stars, and the concepts of black holes and dark matter.
