Behavioral Perspective

The behavioral perspective focuses on observable behaviors and the ways in which they are learned through interactions with the environment. This perspective emphasizes the role of reinforcement and punishment in shaping behavior. Key figures in this field include B.F. Skinner and John Watson,

who contributed to our understanding of how conditioned responses can influence actions.

Cognitive Perspective

The cognitive perspective explores internal mental processes such as perception, memory, thought, and problem-solving. This approach highlights how individuals process information and how cognitive biases can affect decision-making. Feldman discusses the contributions of key theorists like Jean Piaget and Aaron Beck, who have significantly influenced cognitive psychology.

2. **Formulating a Hypothesis:** A hypothesis is a testable prediction based on existing theories

or observations.

3. **Choosing a Research Method:** Various methods, including experiments, surveys, and observational studies, are selected based on the research question.
