Overview of the Chicken Life Cycle

The life cycle of a chicken consists of several distinct stages. Understanding these stages can be simplified through visual aids like worksheets. Here's a brief overview:

1. Egg

The life cycle begins with a fertilized egg. Chickens lay eggs, which can be incubated either naturally by a hen or artificially in an incubator.

2. Embryo Development

Inside the egg, the embryo develops over a period of 21 days. During this time, it goes through various growth stages, including the formation of organs, feathers, and eventually, a fully formed chick.

3. Hatching

After about three weeks, the chick hatches out of the egg. This process is known as pipping, where the chick uses its beak to break through the eggshell.

4. Chick

Once hatched, the chick is covered in down feathers and is dependent on its mother for warmth and food. This stage lasts until the chick matures.

5. Grower

As the chick grows, it undergoes various changes in feathers and size. At this stage, it begins to explore its surroundings and starts to eat solid food.

6. Adult Chicken

After several months, the chicken matures into an adult. Depending on its breed, it will either lay eggs or be raised for meat.
