Key Concepts in Corporate Finance

Understanding the fundamental concepts of corporate finance is essential for success in the field. Some of these key concepts include:

Time Value of Money

The time value of money (TVM) is a principle that asserts that a dollar today is worth more than a

dollar in the future due to its potential earning capacity. Key components include:

- Present Value (PV): The current worth of a future sum of money given a specific rate of return.
- Future Value (FV): The amount of money that an investment will grow to over a period at a given interest rate.

Risk and Return Trade-off

Investors seek to maximize returns while minimizing risk. Understanding the risk-return relationship is crucial for making informed investment decisions. This concept involves:

- Expected Return: The anticipated return on an investment, factoring in potential risks.
- Standard Deviation: A measure of the investment's risk, indicating the volatility of returns.

Capital Asset Pricing Model (CAPM)

CAPM is a model that describes the relationship between systematic risk and expected return. It helps investors assess whether an investment is worth the risk. The formula is:

$$\text{Expected Return} = \text{Risk-Free Rate} + \beta \times (\text{Market Return} - \text{Risk-Free Rate})$$

where β (beta) measures the sensitivity of the investment's returns to market returns.
