Understanding Earthquakes

What is an Earthquake?

An earthquake is a sudden and rapid shaking of the ground caused by the movement of tectonic plates beneath the Earth's surface. These movements can result from several factors, including:

1. **Tectonic Plate Movement:** The Earth's crust is divided into large plates that float on the molten layer beneath. When these plates shift, they can cause earthquakes.
2. **Volcanic Activity:** Earthquakes can also occur in volcanic regions and are often associated with the movement of magma.
3. **Human Activities:** Certain human activities, such as mining, reservoir-induced seismicity from large dams, or geothermal extraction, can also induce earthquakes.

Types of Earthquakes

There are several types of earthquakes, categorized based on their causes:

- **Tectonic Earthquakes:** Result from the movement of tectonic plates at fault lines.
- **Volcanic Earthquakes:** Occur in volcanic areas due to magma movement.
- **Collapse Earthquakes:** Result from the collapse of underground caves or mines.
- **Induced Earthquakes:** Man-made seismic events due to human activities.
