Building Geometries

Designing geometries in HFSS involves several steps:

- Using Primitives: Start with basic shapes like boxes, cylinders, and spheres to construct your model.
- Boolean Operations: Combine or subtract geometries using operations such as union, intersection, and difference.
- Parametric Modeling: Define parameters for dimensions, allowing for easy modifications and optimizations.

Setting Up the Simulation

Once the geometry is created, the next step is setting up the simulation parameters.

Defining Materials

In HFSS, materials play a crucial role in determining the electromagnetic properties of the model. To define materials:

1. Open the Materials window.
2. Select from predefined materials or create a custom material by specifying its relative permittivity, permeability, and conductivity.

Boundary Conditions

Boundary conditions define how electromagnetic fields interact with the model's surfaces. Common boundary conditions include:

- Perfect Electric Conductor (PEC)
- Perfect Magnetic Conductor (PMC)
- Open Boundary: Used for radiating structures to simulate free space.

To apply boundary conditions:

1. Select the surface or volume you wish to modify.
2. Choose the desired boundary condition from the Properties window.

Excitations

Excitations are sources of electromagnetic waves that stimulate the model. Common types of excitations include:

- Wave Ports
- Lumped Ports
- Voltage Sources

To define an excitation:

1. Click on the appropriate area of the model.
2. Choose the excitation type from the menu and adjust its parameters.

Running Simulations

After setting up the model and simulation parameters, the next step is to run the simulation.

Simulation Types

HFSS offers multiple simulation types:
