

html css and dynamic html

HTML, CSS, and Dynamic HTML are foundational technologies that form the backbone of web development. Understanding these technologies is crucial for anyone looking to create engaging and interactive web applications. In this article, we will explore what HTML and CSS are, how they work together to create visually appealing web pages, and the role of Dynamic HTML (DHTML) in enhancing user experience. By the end, you will have a comprehensive understanding of these essential web technologies.

What is HTML?

HTML, or HyperText Markup Language, is the standard markup language used to create web pages. It provides the structure of a webpage by using a series of elements or tags that define different parts of the content. HTML allows developers to organize text, images, links, and other media types in a meaningful way.

Key Features of HTML

- Semantic Structure: HTML uses semantic tags such as `<h1>`, `<h2>`, `<h3>`, `<p>`, `<img alt="image description" />`, and `<a href="url">` to give context to different parts of the webpage, improving accessibility and SEO.
- Hyperlinks: HTML allows for the creation of hyperlinks using the `<a href="url">` tag, enabling navigation between different pages or external websites.
- Multimedia Support: HTML can embed images, audio, and video content, making it easier to create rich multimedia experiences.
- Forms: HTML provides form elements like `<input type="text">`, `<input type="password">`, and `<input type="checkbox">`, allowing for user input.

What is CSS?

CSS, or Cascading Style Sheets, is a

Key Features of CSS

- Separation of Content and Style:

- Responsive Design: CSS enables

- Styling Flexibility: CSS

- Selectors and Specificity: CSS
